

Finish My Dish

Team

Drew Hoffman, Alex Calderon, Jared Brady, Vanessa Reyes, Katelyn Singh

Project Description:

Finish My Dish is a website designed to help people use ingredients they have on hand in order to prevent food waste. It is a way to share recipes with others. Each user makes their own account with which they can post their own recipes. Using this format, the ingredients needed to make any specific recipe are stored.

A user must create an account to use the site. Each user has the ability to search for recipes and save them to their profile, post their own recipes, and have friends. When searching for a recipe the user can do a normal search, such as “pizza”, or an advanced search. The advanced search option allows the user to put in a keyword, rating, if it needs to be gluten/vegan/vegetarian, the ingredients they have, and the maximum make time. This allows the user to narrow down their search to recipes that apply to them. From the user’s friends you can view their friends and their recipes.

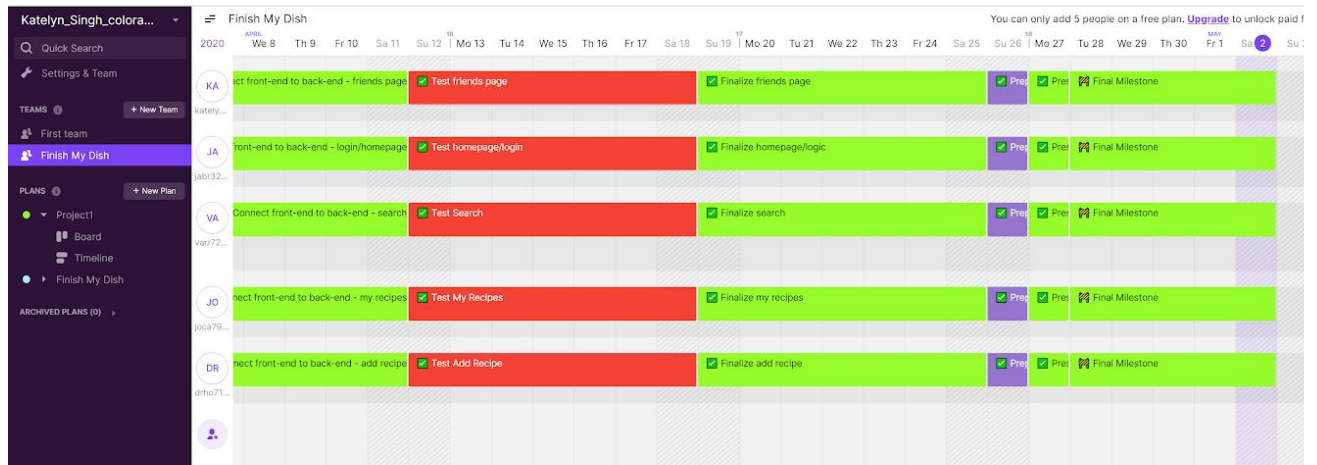

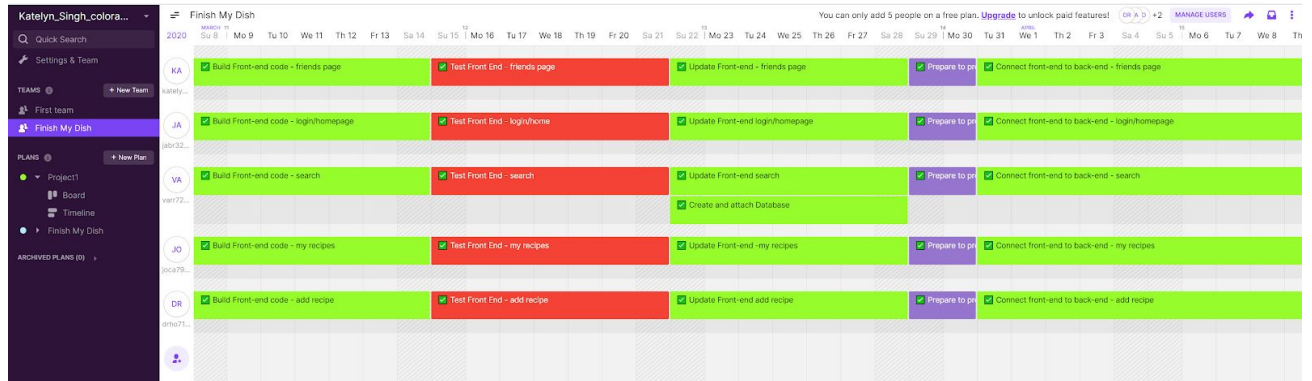

In addition to logging in, the user can log out so that others cannot access their information while not using the app. All information is stored in a database and can be accessed at a later time. Finish My Dish aids in everyday life and meal planning.

Project Tracker:

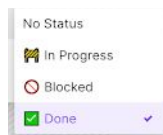

Toggl: <https://plan.toggl.com/#timeline/530221/teams/554274?zoom=month>

(this link won’t work unless we add you to the plan. We can’t add more than 5 people to the plan with the free version)

Briefing:

- Drew Hoffman
 - I created the new recipe page. It consisted of an html form to receive various information about the recipe and send the information to the cloud database. Successfully implemented sending the recipe to the database to be saved under a specific user as well as saving images to cloud storage. Used Firebase and Javascript.
- Jose Calderon
 - I worked on my Recipes page with reading from our database in order to pull the recipe information for a specific user, and any assigned work that was split for the group for things such as milestones.
- Jared Brady
 - I worked on the login and signup page as well as the functionality of being logged in with a user on each page. Firebase has a built-in authentication tab and functions for doing so, when I created a new user it would be added to both the authentication tab and the database, with their ID's being linked. I did this so that each account can have attributes such as a username and saved recipes. For each page it would call the authentication functions and see if there is a current user logged in.
- Vanessa Reyes
 - Implemented the Search page as well as the home page. Created a Firebase project to allow deployment and hosting of our project. Initialized and formatted database in Firebase to hold user and recipe information. I made sure that deployment on Firebase was completed and checked if the project matched and ran similar to our local code.
- Katelyn Singh
 - I implemented the friends page front end and connection of it to the database. Each user had their own friends that needed to be accessed through the database and displayed using cards via HTML, css and js. I created the milestone documents and did a lot of work on the milestone's as well as helping the group stay on track with getting them done by their deadlines.

Deployment:

- Link: <https://finish-my-dish.web.app/>
- Description: We deployed our website through firebase.
